## Mid-Atlantic Governors' Agreement on Ocean Conservation

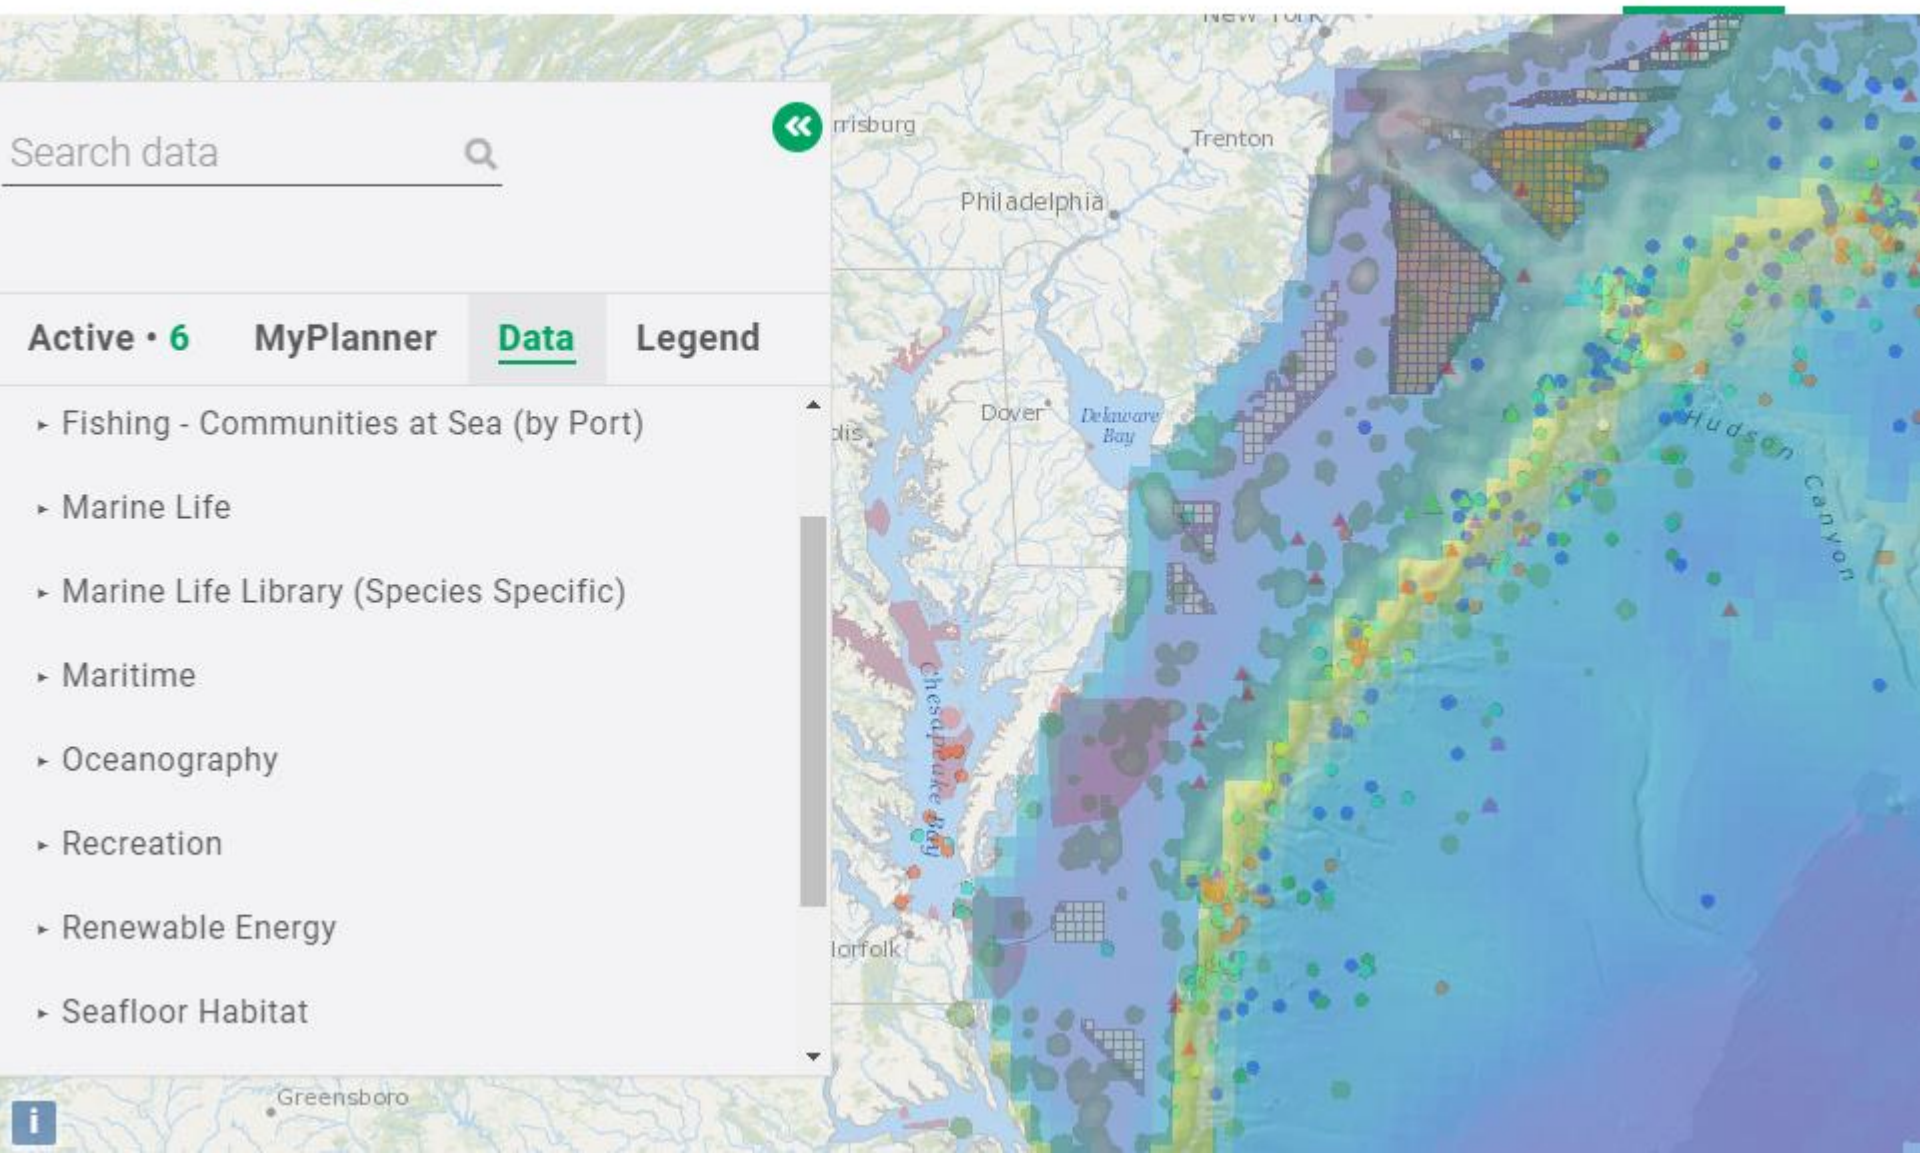

### A Rising Tide of New Challenges

The ocean waters of the Mid-Atlantic, stretching from New York to Virginia, provide a wealth of economic and

1. Promotion of Offshore Renewable Energy
2. Ocean Habitat Protection
3. Ocean Water Quality
4. Regional Climate Adaptation

# 2010 Created MARCO Ocean Data Portal

Welcome to the Mid-Atlantic Ocean Data Portal, an ocean planning resource center, and the **Marine Planner**, an Interactive mapping tool.

## Data Catalog

The Data Catalog offers background information, download options, metadata and important links pertaining to map layers found on the Portal. You can explore the data available under each of the Portal's themes below.

To learn more about how data is selected for inclusion in the Portal, read our [Spatial data evaluation and criteria](#) (pdf) fact sheet.

**20** Administrative  
 Numerous federal, regional, and state political and management boundaries of the Mid-Atlantic are compiled here to provide a regulatory context to help facilitate well-informed ocean planning decisions.

**142** Fishing  
 Explore dozens of maps depicting the extent and locations of commercial and recreational fishing activities throughout the upper East Coast.

**7** Fishing - Communities at Sea (by Port)  
 Search nearly 1,000 maps showing commercial fishing activity by several gear types for 200 individual ports along the East Coast.

**538** Marine Life  
 The Mid-Atlantic region is well known for nutrient-rich and

**13** Marine Life Library (Species Specific)  
 The Marine Life Library is home

**129** Maritime  
 The Mid-Atlantic ports are some of the busiest in the nation's

**188** Oceanography  
 From the depths of the Mid-Atlantic's submarine canyons to its sandy beaches, explore the physical and chemical properties of the ocean through our Oceanography theme, now under development.

**21** Recreation  
 The Mid-Atlantic boasts countless opportunities for entertainment and leisure activities and has flourishing travel, tourism, and outdoor recreation industries, many of which are focused on the region.

**33** Renewable Energy  
 Offshore wind in the Mid-Atlantic holds more than 60,000 Megawatts of potential energy that's 10% of total U.S. offshore potential. This huge resource could help meet the growing electricity demand in the region.

**54** Seafloor Habitat  
 From its vast, gently sloping continental shelf to its steep, rocky canyons, the region's seafloor terrains support diverse and vibrant ecosystems.

**10** Security  
 The Mid-Atlantic is home to important naval installations and training areas, and it's a busy corridor for commercial shipping and naval and other defense and security operations.

**6** Socioeconomic  
 Learn about the ocean's value to your local economy with the Portal's Socioeconomic data. The map data are derived from the Economics: National Ocean Watch (ENOW) Explorer database, available through...

# 2016 CZM Grant to VCU for Research on Electromagnetic Effects on Fish

## Electromagnetic Field Effects on Marine Fishes in the Mid-Atlantic

### Wind Farms and Electromagnetic Fields

Many countries around the world, including the United States, are looking for ways to increase the amount of electricity generated through renewable energy sources. For coastal states, Virginia included, this has led to an exploration into offshore wind energy. As offshore wind farms develop, it is important to investigate potential impacts to the ocean ecosystem. This document summarizes the current state of knowledge regarding interactions between marine fish species and the Electromagnetic Field (EMF) emitted from transmission cables.

Along the east coast, several offshore wind farms are in development and one is already operational. The Block Island Wind Farm off of Rhode Island was the first commercial offshore wind farm in the United States. Similar projects in Maryland, New Jersey, and Virginia are in various stages of development.

Twenty-seven miles off the coast, Virginia is moving forward on the mid-Atlantic's first offshore wind project in a federal lease area. Virginia is working with Dominion Energy and Ørsted Energy of Denmark, a global leader in offshore wind development, to build two 6-megawatt turbines in the Coastal Virginia Offshore Wind (CVOW) research lease area. Individual turbines in offshore wind farms typically connect to one or more main transmission power cables leading back to the mainland. These high voltage underground cables

### What are Electromagnetic Fields?

Electromagnetic fields, otherwise known as EMF, include fields emitted from both electric and magnetic sources. EMFs are generated naturally as well as by human activities. Magnetic fields are used for orientation and migration by some fish and animals. Electric fields allow fish to detect prey and predators which assists with feeding and predator avoidance.

emit a measurable EMF (although the field emitted has been shown to be less than that of typical household appliances). An EMF can be measured in terms of the intensity of both the magnetic and electric fields, as well as its frequency.<sup>1</sup>

Because some fish use the Earth's magnetic fields for navigation and other fish detect electric fields as part of their search for prey, EMF associated with transmission cables has been studied for its impacts on fish behavior. Research to understand how EMF affects fish has focused on the most sensitive species to determine whether significant negative or positive impacts are associated with exposure to these introduced sources of EMF.

### What do we know about cables and burial?

Two types of cables may be used in transferring wind generated electricity in coastal waters in the United States: alternating current (AC) and direct current (DC). AC power transmission cables are used extensively in Europe for offshore energy facilities, and many of the offshore wind projects proposed in the US.<sup>2</sup> Smaller interarray cables are used to connect the turbines and a larger export cable takes the electricity to shore.

Cables are covered in sheathing to protect the cable and minimize the electric field from affecting the external environment. This sheathing usually includes steel wires or tape around the cables to enhance the mechanical strength of the cable, and the thicker the sheathing materials the weaker the strength of the EMF outside the cable.<sup>4</sup> The cables are generally buried by ocean currents or trenched at a depth of about 6 feet, so benthic and demersal (bottom and near bottom) fish and shellfish are more exposed to EMF than species living elsewhere in the water column. Burying the cables is a way to mitigate EMF exposure, and the EMF measured above buried cables becomes equal to natural background EMF within a few meters of the cable.<sup>2</sup>

### What do we know about how marine species are impacted by EMF?

The Bureau of Ocean Energy Management (BOEM) has evaluated published research to summarize the potential effects of EMF on both demersal (bottom species) and pelagic (open water) fish and shellfish species. Reported information on actual sensitivity to EMF exists only for a handful of the most sensitive species, as this research is still developing.<sup>3</sup> Research findings are summarized below and effects are noted by the following legend:

**B** Behavior **M** Migration & movement **V** Vital Signs

Species	Impacts
<b>Bony Fishes</b>  <b>B M V</b>	<ul style="list-style-type: none"> <li>Different species of bony fishes respond differently to EMF exposure.</li> <li>Atlantic cod do exhibit some sensitivity toward emitted EMF<sup>5</sup></li> <li>European flounder exhibited no response to EMF<sup>6</sup></li> <li>Potential orientation and navigation effects were documented on Atlantic King, and Spanish mackerel species.<sup>7</sup></li> <li>Salmon and trout species detect magnetic fields to help determine their migratory patterns and EMF could disrupt migration behavior.<sup>8</sup></li> <li>Some behavioral and anatomical responses by yellowfin tuna have been reported.<sup>9</sup></li> <li>Salmon have elevated heart rates in some EMF ranges.<sup>10</sup></li> <li>Chinook salmon and green sturgeon migration was not impeded by an HVDC cable.<sup>11</sup></li> <li>EMFs can slow embryonic development of brown trout and rainbow trout in freshwater environments.<sup>12</sup></li> <li>EMF can change blood circulation in embryos and larvae of pike, carp, and brown trout.<sup>13</sup></li> <li>There are conflicting reports on whether or not EMF affects predator and prey detection and navigation in sturgeon species.<sup>14</sup></li> </ul>
<b>Eels</b>  <b>M V</b>	<ul style="list-style-type: none"> <li>European eels decrease their swimming speed as they pass over cables; the effect is short-lived and determined to be of minor significance.<sup>15</sup></li> <li>Eels have elevated heart-rates when exposed to certain levels of EMF.<sup>16</sup></li> </ul>
<b>Sharks</b>  <b>B M</b>	<ul style="list-style-type: none"> <li>Sharks and rays are 14,000 times more sensitive to EMF than bony fish.<sup>17</sup></li> <li>Scientists have found evidence of EMF effects on multiple species of sharks and rays including prey and predator detection and navigation issues.<sup>18</sup></li> <li>Attraction to cables varies by species and the intensity of the emitted EMF; some species are attracted to the cables while others are repelled.<sup>19, 20</sup></li> <li>Some species of sharks can detect buried cables up to 20 meters away.<sup>21</sup></li> <li>Some species have been shown to attack exposed electrodes emitting EMF in some instances.<sup>22</sup></li> <li>Sandy dogfish, <i>Scyliorhinus canicula</i>, were found to non-randomly associate nearer to the cables when energized.<sup>23</sup></li> </ul>
<b>Skates &amp; Rays</b>  <b>B M</b>	<p>Skate species differ in their responses to EMF exposure including:</p> <ul style="list-style-type: none"> <li>Little Skates (<i>Leucoraja erinacea</i>) traveled farther but more slowly which could mean higher energetic costs.<sup>24</sup></li> <li><i>L. erinacea</i> make larger turns, which could be attributed to increased exploratory activity and/or area restricted foraging behavior.<sup>25</sup></li> <li>Thornback skates (<i>Raja clavata</i>) exhibited a response to the EMF from an energized cable; the response was variable and not predictable.<sup>26</sup></li> </ul>
<b>Shellfish</b>  <b>B M</b>	<p>The American lobster had small behavioral responses to EMF exposure including:</p> <ul style="list-style-type: none"> <li>Lobsters were observed making larger turns while foraging.<sup>27</sup></li> <li>Small behavior effects on the lobsters that did not act as a barrier to movement.<sup>28</sup></li> </ul>

## VIRGINIA'S COMMERCIAL FISHING: BEYOND THE BAY

A report on the value of Virginia's  
ocean-caught fisheries

Photo by Alexander In | Virginia Sea Grant

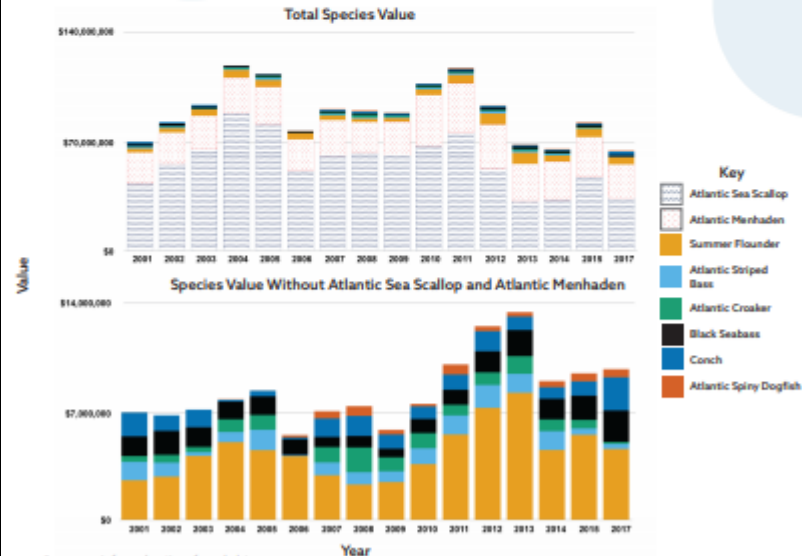

Virginia Coastal Zone  
MANAGEMENT PROGRAM

June 2021

### THE VALUE OF VIRGINIA'S MOST COMMERCIALY IMPORTANT OCEAN-CAUGHT SPECIES

Commercial fishermen travel from just a few miles offshore to hundreds of miles off New England to fish before heading back to their home ports in Virginia. This section summarizes landing information on some of Virginia's most important commercial species caught beyond the Chesapeake Bay, from the mean low water (MLW) mark to 200 nautical miles offshore in the Atlantic Ocean. Hard clams and oysters have been excluded from these data because they are not typically considered ocean-caught species. These data were derived from both the Virginia Marine Resources Commission and NOAA landings, removing those values associated with the Chesapeake Bay to arrive at the value of species caught in the Atlantic, except for the value of conch\*. The first graph below shows the combined value of some of Virginia's most commercially important species caught in the Atlantic Ocean from 2001-2015, and 2017. The second graph shows the same data as the first, but without the values of Atlantic sea scallop and Atlantic menhaden to show data for other species in greater detail. The values of Atlantic sea scallops and Atlantic menhaden are orders of magnitude larger than the other species, and emphasize the importance of the fisheries to Virginia.

\*see page six for explanation of conch data

# 2021-25: 3<sup>rd</sup> CZM Ocean Strategy

**Virginia Coastal Zone**  
MANAGEMENT PROGRAM

**VIRGINIA SECTION 309**  
**COASTAL NEEDS ASSESSMENT**  
**& STRATEGIES**

Draft submitted to NOAA July 2, 2020.  
Final version submitted to NOAA January 27, 2021.  
Approved by NOAA February 4, 2021.

Every five years the Virginia CZM Program assesses the Commonwealth's coastal resources and management efforts. High priority topics are then chosen and 5-year grant strategies are designed to result in new enforceable policies to manage better those high priority resources or issues.

- Develop a Virginia Ocean Plan
- \$183k/year for 5 years
- NOAA-approved
- Includes stakeholder engagement in :
  - **Policy** development
  - ID of additional **OSW lease area(s)**, offshore **aquaculture** areas and potential **conservation** areas in support of 30% by 2030 goal
  - Refinement & implementation of VA **ocean acidification** plan
  - Incorporation of **marine mammal/sea turtle conservation** plans
